

Multi Directional Forklift

Used Side Loader Forklift Portland - The side loader forklift is designed for lifting heavy cargo in narrow locations including loading docks, lumber yards and warehouse aisles. Side loaders have earned their name due to their design and the way they transport, load and unload items. Benefits of Side Loader Forklifts v Standard Forklifts Forklifts which operate on the standard counterbalance system may become unstable when loading, transporting or unloading heavy, long loads. The side loader forklift can tackle these awkward loads including timber and extensive pipes with greater stability. Having the load face the direction of travel ensures that timber and steel can be easier to maneuver. Side loaders gift the operator with an unobstructed view. This is often compromised on standard forklifts with the tines or front-carrying load design. Since the loads are transported along the side of the forklift instead of across the front, the side loader can travel easier through narrow aisles and doorways. The load may have to be lowered or raised to get past obstacles that can increase the chances of destabilizing and cause dangerous tip-overs. A side loader forklift makes much of that maneuvering unnecessary. These units help warehouse locations to manage smaller spaces much more safely. Many models can lift up to 12K lbs. while traveling at speeds higher than 5 miles an hour. There may be the ability to have travel speeds programmed. This design enables operators to match speed to a certain job.

Types of Side Loader Forklifts Class 2 - Electric Motor Narrow Aisle Trucks The Class 2 Electric Motor Narrow Aisle Trucks are where the side loader forklifts are classified. This classification, as the title description suggests, encompasses forklifts that operate in narrow aisles and are powered by an electrical source. Excellent for operating in loading docks and warehouses, these units rely on narrow aisle configuration and are moved between close quarters common for storing lumber, bar stock, laminate and carpet. These machines are additionally used for rack storage and feeding machine tools. The narrow aisle set up is common in warehouses because it allows for the maximum possible use of a storage area which helps to save on costly square footage as well as travel time between material and loading and unloading areas. These Class 2 side loader forklifts are designed to minimize the area taken up by the forklift truck. These machines create better efficiency and speed while moving, unloading and loading narrow aisle locations. Electric power reduces harmful emissions and allows these machines to be used mainly inside.

Internal Combustion Engine Side Loader Forklifts Only side loaders that rely on electricity are in the Class 2 forklift classification. Side loaders are found in timber and lumber yards and pipe and steel yards for transporting long and heavy loads. They can move items from flatbed trucks, stack items in blocks or racking. Side loaders used in these contexts must be able to work outdoors, often in varying temperatures and over uneven surfaces. There are internal combustion models available and they may use pneumatic tires for more stable transport. Side loaders can efficiently load cumbersome items that are long and heavy by securing them in the middle.

Side Loader Forklift Design The side loader forklift comes in two basic designs: 1. Stand on; and 2. Sit down.

Stand On Side Loader Forklifts Stand-on side loaders are found in warehouses and interior applications. They feature a small platform generally found in the middle of the unit that is where the operator stands and is surrounded by controls. The stand on unit has many advantages. The stand on side loader does not require a seat for the operator which allows for a smaller cab design. This means the forklift has a smaller footprint which is an advantage when maneuvering around tight, high-traffic areas. Especially while operating in reverse, there is greater operator visibility from a standing position. In the stand up position, an operator can turn his whole body to view the rear of the truck when reversing direction whereas in a sit down position the operator must twist his back and neck to get a clear view behind. There are more safety and operator comfort in the stand-up side loaders, ensuring better visibility and less potential for damage or injury. Operators can get onto and off of the stand up forklift faster compared to a sit-down model and this may increase efficiency in certain situations.

Sit Down Side Loader Forklifts The sit-down side loader is more popular than standing loaders. Much like the stand on side loader, the sit down

design has a cab usually located at the center of the truck. The sit-down models have a raised platform and a seat that is opposite to the controls. The advantages of a sit down side loader are mostly in operator comfort. The machine enhances productivity and reduces fatigue when operators can work from a resting position.

Customizable Features The side loader has customizable bed length options to be suitable for many jobs. Popular for heavy and bulky items, the standard side loader has been designed to fit heavy and bulky loads. A sixty-inch extension upwards may be utilized for special jobs. A side loader cannot be customized before bed length considerations are given to ensure that guide rails and aisle widths can accommodate. One popular feature for these forklifts is multidirectional capability. Side loaders have crab steering to enable them to have two wheels operate separately from others. Crab steering allows the unit to travel in all four directions by changing the direction of the wheels. The side loader can fit into close quarters and narrow spaces without needing to make huge turns or adjustments. Safety is increased with the tighter turning radius and damage is avoided to facilities and items. Efficiency is further achieved by lessening the space and time required to travel around the job. It is possible to customize a variety of side loader forklift features for specific jobs. Tine length, mirrors, lights, lift mast heights and lift capacities are some of the custom options available. Certain features are also adjustable, allowing for further customization of the side loader for the particular job application. Travel speed, acceleration time, load limits and breaking force can all be set allowing further job efficiency and increased workplace safety. For all of the above reason, the side loader forklift has become the most popular option for workplaces where space is limited and long loads are involved.
